

# Weekly Client Progress Summary (Days 1–8)

## Weekly Client Summary

The client actively engaged throughout the eight-day coaching period by consistently sharing updates on meals, sleep, hydration, exercise, symptoms, and daily routine. The week began with poor sleep, acidity, bloating, and irregular eating because of school and work commitments. As the days progressed, the client gradually adopted healthier habits, including improved meal choices, regular walking, stretching, and better hydration. A stressful workday temporarily reduced energy and mood, but after achieving around eight hours of sleep, the client reported a noticeable improvement in overall energy while mild bloating continued occasionally.

## Nutrition Adherence

Overall adherence was moderate (about 70%). The client regularly consumed vegetables, curd, paneer, roasted chana, kala chana, seeds, and later ordered sprouts to improve protein intake. However, meals were sometimes skipped or delayed due to a busy schedule, breakfast protein was inconsistent, and salad before lunch was often missed.

## Exercise / Steps

The client maintained a good level of physical activity through walking, Surya Namaskar, stretching, breathing exercises, running, and household work. Daily steps ranged between approximately 4,500 and 8,000, demonstrating consistent movement throughout the week.

## Sleep

Sleep duration was mostly around 5–5.5 hours during the first week, contributing to fatigue, acidity, and low energy. By Day 8, sleep improved to approximately eight hours, resulting in significantly better energy levels.

## Water Intake

Hydration remained good, with reported intake ranging from 3.5 to 4 litres per day.

## Symptoms / Stress

The client experienced acidity, bloating, fluctuating energy, and concerns about weight gain despite eating less. School commitments, office pressure, and workplace politics increased stress levels. One particularly exhausting day led to the client briefly falling asleep during a meeting.

## Engagement Level

The client demonstrated excellent engagement by providing regular updates, asking relevant questions, implementing suggestions, and honestly reporting progress and challenges.

## Key Barriers

Major barriers included insufficient sleep, inconsistent meal timing, difficulty planning meals, low breakfast protein, forgetting healthy habits initially, and work-related stress.

## Pending Actions

Improve sleep consistency to 7–8 hours, include protein in breakfast daily, prepare meals in advance, add salad before lunch, continue ACV habit, maintain hydration and 8,000 daily steps, and monitor bloating symptoms.

## **Risk / Attention Flags**

Persistent bloating, recurrent acidity, low protein intake, and chronic sleep deprivation require monitoring. The episode of extreme fatigue and low mood highlights the importance of stress and recovery management.

## **Recommended Next Action for the Coach**

Continue monitoring sleep, bloating, and stress while encouraging simple meal preparation, regular protein intake, hydration, and sustainable habit building.

## **Evidence Classification**

Confirmed Facts: improved sleep, regular hydration, physical activity, and reported step counts. Client-Reported Information: bloating, acidity, stress, low mood, and meal-planning challenges. AI Inference: improved sleep likely contributed to increased energy, while irregular meals and inadequate sleep may have worsened acidity and bloating. Missing Information: exact calorie intake, protein quantity, medical history, laboratory reports, and detailed body measurements.

## **Human Review**
